Is a 21700 protected battery better than an unprotected battery?

A 21700 protected battery is saferthan an unprotected one,as it is less likely to overheat, burst, or start on fire. While unprotected 21700 batteries are cheaper, they should only be used where the load/draw and charging is externally monitored and controlled.

What is the difference between a 21700 and a 5000 mAh battery?

This larger size allows for greater energy storage capacity compared to smaller batteries, making it an attractive option for various applications. The capacity of 21700 batteries typically ranges from 3000mAh to 5000mAh, providing longer runtimes for devices that demand high power.

For my next battery build I'll be looking to stuff as many cells in an EEB frame as possible. I used the standard 21700 cell spacers in my last build but obviously not using spacers would allow a lot more cells in total. I've seen people hot glue cells together, then fish tape parallel groups. A few other methods too.

The 21700 battery is a lithium-ion rechargeable battery measuring 21mm in diameter and 70mm in length, hence the name "21700." Slightly larger than the popular 18650 battery (18mm x 65mm), the 21700 was originally developed to provide longer battery life and greater power output in high-demand devices like electric vehicles and power tools.
