A global approach to hazard management in the development of energy storage projects has made the lithium-ion battery one of the safest types of energy storage system. 3.

Why is safety management important for lithium-ion energy storage systems?

Safety management is a fundamental feature of all lithium-ion energy storage systems. Safety incidents are, on the whole, extremely raredue to the incorporation of prevention, protection and mitigation measures in the design and operation of storage systems.

Are battery energy storage sites at risk of fire?

A common concern raised by some communities living close to sites identified for battery energy storage systems is around the risk of fire. In this section we will outline how this threat is guarded against but first it is important to understand where the risk of a fire comes from.

Why is safety important in energy storage systems?

Safety is fundamental to the development and design of energy storage systems. Each energy storage unit has multiple layers of prevention, protection and mitigation systems (detailed further in Section 4). These minimise the risk of overcharge, overheating or mechanical damage that could result in an incident such as a fire.

(2) Battery system: The proportion of LIBs using a cathode of LiNi x Mn y Co z O 2 (x + y + z = 1; NMC) in battery-related accidents is significantly higher than that of LIBs using a lithium iron phosphate (LiFePO 4, LFP) cathode, indicating that there is a statistical correlation between energy density and safety; that is, the higher the energy density of a battery, the ...
