The expansion of concentrated solar power increases demand for chromium, copper, manganese and nickel. Between 2020 and 2040 in the SDS, chromium demand from CSP grows by 75 times (to 91 kt), copper demand grows by 68 times (to 42 kt), manganese demand grows 92-fold (to 105 kt), and nickel demand grows 89-fold (to 35 kt).

These batteries are known for their high energy density and long shelf life, making them ideal for applications where long-lasting power is required in a compact size. Key Features of Li-Metal Batteries: High Energy Density: Lithium metal batteries have a very high energy density compared to other battery types, such as alkaline or zinc batteries.

NiMH batteries typically have a lower energy density, around 60-120 Wh/kg. This means they store less energy for the same weight compared to Li-ion batteries. Though still efficient, typically have a lower energy

density. This means they may not provide the same power-to-size ratio as Li-Ion batteries. Part 2. Lifespan
