### What is electrochemical storage system?

The electrochemical storage system involves the conversion of chemical energy to electrical energyin a chemical reaction involving energy release in the form of an electric current at a specified voltage and time. You might find these chapters and articles relevant to this topic.

What are some examples of electrochemical energy storage devices?

Earlier electrochemical energy storage devices include lead-acid batteries invented by Plante in 1858 and nickel-iron alkaline batteries produced by Edison in 1908 for electric cars. These batteries were the primary energy storage devices for electric vehicles in the early days.

### What are electrochemical energy storage/conversion systems?

Electrochemical energy storage/conversion systems include batteries and ECs. Despite the difference in energy storage and conversion mechanisms of these systems, the common electrochemical feature is that the reactions occur at the phase boundary of the electrode/electrolyte interface near the two electrodes.
