MPS"s advanced battery management solutions enable efficient and cost-effective low-voltage energy storage solutions. All of the battery cells within a low-voltage ESS must be carefully managed to ensure safe and reliable operation across a long operating life. This requires a high-performance battery management system (BMS).

Vehicles containing a high voltage Electrical System have particular removal requirements for the treatment of the high voltage system before the vehicle can be treated as a regular ELV. It is important to recognize and understand the High Voltage Electrical System and its specifications for the safe handling of the vehicle at ELV stage.

Energy Storage Systems are structured in two main parts. The power conversion system (PCS) handles AC/DC and DC/AC conversion, with energy flowing into the batteries to charge them or being converted from the battery storage into AC power and fed into the grid. Suitable power device solutions depend on the voltages supported and the power flowing.

Secondly, the high voltage box carries out the high voltage management in the vehicle, and especially the energy distribution from the high voltage battery to the consumers plus providing the DC charging function at high power charging points with a three-digit kW level of charging power. Thirdly, it powers the traditional 12-V net.
