Solar PV System Solar energy is radiant light and heat from the sun that is converted into electricity through photovoltaic panels. Photovoltaic panels use silicon to directly convert sunlight into electricity. A solar PV system may be connected to the electric grid to sell excess power back to the utility company, as measured by a net meter.

It does not discuss any experimental model. In [33], different existing performance and reliability evaluation models are discussed. Classification of these models is based on different photovoltaic technologies. All models that have been discussed in this paper are material specific and cannot be generalized for all kind of PV panels.

) of the parallel-connected PV-panels and the sum of open-circuit voltages (V oc) of the series-connected PV-panels. Regarding switches, the PV system voltage should be determined as the maximum obtainable voltage, i.e., the open-circuit voltage of the series-connected PV sources. However, the "nominal system voltage" is often stated as be-
