An uninterruptible power supply (UPS) is a device that provides temporary backup power to connected equipment when the traditional power supply is lost. (Anthony C. Caputo, 2010) It uses energy-storing backup batteries, an AC-DC charger to keep the battery fully charged, and a DC-AC inverter to provide the necessary power to the required equipment.

The connection in parallel of the inverters that constitute an uninterruptible power supply system through decentralized and without communication control strategies, allows to obtain high availability factors and a certain degree of flexibility in the physical location of the inverters [1], [2]. Among them, droop control emulates the dynamic behavior of synchronous ...
