Inverter's Efficiency; The voltage of the battery at its lowest; Maximum Amp Draw for 85%, 95% and 100% Inverter Efficiency. A. 85% Efficiency. Let us consider a 12 V battery bank where the lowest battery voltage before cut-off is 10 volts. The maximum current is = (1500 Watts ÷ Inverter's Efficiency (%)) ÷ Lowest Battery Voltage (in Volts)

For example, if the voltage at the terminals of the battery bank is 12 Volts, but the voltage at the input terminals of the inverter is 10.8 Volts, the voltage drop is 1.2 Volts. For a 12V system, a 1.2V voltage drop means a 10% voltage drop, which then translates into 10% losses in power and energy, which is very inefficient.

The input voltage should match the voltage of the battery bank or solar panel array used in your system. For example, if you have a 12V battery bank, you need an inverter that can accept 12V input. For a larger solar system or industrial setup, a 48V inverter may be more appropriate.
