

Are batteries the future of energy storage?

Developments in batteries and other energy storage technology have accelerated to a seemingly head-spinning pace recently -- even for the scientists, investors, and business leaders at the forefront of the industry. After all, just two decades ago, batteries were widely believed to be destined for use only in small objects like laptops and watches.

#### Will 2024 be a good year for battery energy storage?

Among many things,2024 will probably remain a marker for the momentumit built up for Battery Energy Storage Systems (BESS). So sharp has been the pick up here that even countries like the UK which had special focus on Pumped Hydro Storage (PSP) have changed rules in recent weeks to allow BESS projects to fill key energy storage needs.

#### Why should you invest in a battery?

Batteries support grid services like frequency response, reserve capacity, and black-start capability, enabling higher shares of variable renewables. In regions like California, large-scale batteries like Moss Landing store excess solar energy, addressing the "duck curve" and ensuring reliability.

#### Why are battery prices falling in 2024?

Battery costs have fallen down substantially by over 90 percent in recent years to make energy storage an attractive investment for the solar and wind project developers. Notably, the global average lithium-ion battery pack prices have fallen 20 percent to USD 115 per kWh in 2024 which is the biggest annual fall as per BloombergNEF.
